Creative Coding 2

      This week we were assigned to make our pizza from last week's assignment interactive. First I had to remember how to do a lot of the functions and all of the specific coding commands. One thing I like about this class so far is how we go over things we learned in the previous courses in the weekly assignment. For someone like me this is extremely helpful as I often have a very difficult time remembering the functions and having the external site available will help me in the long run. Having chat gtp make an assignment also helps as it gives me a template to work off of and experiment with how I want the assignment. While I was playing around with my part of the assignment I was able to make the base pizza move around very erratically and with a mouse click I could add pepperoni but every time they move outside of the sauce order they freeze until the base pizza moves back to them. I kept one function from ChatGTP that had three green olives following the mouse cursor wherever it went but I forgot to ask in class how that function worked so I am letting you know about that now so I can get an answer about how it works later. One issue I had with the assignment was the positioning of the text, but after getting help in class I was able to figure it out. Moving forward I will hopefully be able to remember some of the functions so I can complete assignments on my own without using ChatGPT too much.
